

Artificial Intelligence & Machine Learning – Task 3

Model Validation, Overfitting Detection & Hyperparameter Tuning

Objective

This task demonstrates how machine learning engineers validate models, detect overfitting, apply cross-validation techniques, optimize hyperparameters using GridSearchCV, and compare multiple models to select the best-performing solution.

Concept	Purpose
Overfitting Detection	Identify poor generalization
Cross Validation	Reliable performance estimation
GridSearchCV	Hyperparameter optimization
Model Comparison	Objective model selection
Evaluation Metrics	Measure predictive quality

Workflow

Dataset → Feature Scaling → Train/Test Split → Overfitting Analysis → Cross Validation → GridSearchCV Tuning → Model Comparison → Final Model Selection

Correlation Heatmap

Split Features and Target

```
[7]: X = df.drop("HousePrice", axis=1)
y = df["HousePrice"]
```

Feature Scaling

Dataset Analysis & Feature Engineering

The California Housing Dataset was analyzed using correlation analysis. Median income showed the strongest relationship with housing prices, making it an important predictive feature.

```
File Edit View Run Kernel Settings Help
JupyterLab Python 3 (ipykernel)

Split Features and target

[7]: X = df.drop("HousePrice", axis=1)
     y = df["HousePrice"]

Feature Scaling

[8]: scaler = StandardScaler()
     X_scaled = scaler.fit_transform(X)

Train-Test Split

[9]: X_train, X_test, y_train, y_test = train_test_split(
     X_scaled,
     y,
     test_size=0.2,
     random_state=42
)

Detect Overfitting Using Decision Tree

[10]: tree = DecisionTreeRegressor(random_state=42)
      tree.fit(X_train, y_train)
      train_pred = tree.predict(X_train)
      test_pred = tree.predict(X_test)

Compare Train vs Test Performance

[11]: from sklearn.metrics import mean_squared_error
      import numpy as np

      train_mse = mean_squared_error(y_train, train_pred)
      test_mse = mean_squared_error(y_test, test_pred)

      train_rmse = np.sqrt(train_mse)
      test_rmse = np.sqrt(test_mse)

      print("Train RMSE:", train_rmse)
      print("Test RMSE:", test_rmse)
      Train RMSE: 3.937681061488083e-16
      Test RMSE: 0.7021725386639983

Interpretation of Overfitting

A large gap between Train RMSE and Test RMSE indicates overfitting.
Decision Trees often overfit when no constraints are applied.

Cross Validation

[12]: cv_scores = cross_val_score(
     tree,
     X_scaled,
     y,
     scoring="neg_root_mean_squared_error",
     cv=5
)
```

Overfitting Analysis

A baseline Decision Tree Regressor achieved near-zero training error while exhibiting substantially higher test error, indicating severe overfitting.

Metric	Value
Train RMSE	≈ 0.000
Test RMSE	≈ 0.702
Observation	Severe Overfitting

Cross Validation & Hyperparameter Tuning

5-Fold Cross Validation was applied to obtain a realistic estimate of model performance. GridSearchCV was subsequently used to identify the optimal Decision Tree configuration.

```
[12]: cv_scores = cross_val_score(
    tree,
    X_scaled,
    y,
    scoring='neg_root_mean_squared_error',
    cv=5
)

cv_rmse = -cv_scores.mean()
print("Cross Validation RMSE:", cv_rmse)
Cross Validation RMSE: 0.806172878864897

[13]: lr = LinearRegression()
lr.fit(X_train, y_train)
lr_pred = lr.predict(X_test)
```

Linear Regression Baseline

```
[14]: print(type(lr_pred))
<class 'numpy.ndarray'>

[15]: lr_mse = mean_squared_error(y_test, lr_pred)
lr_rmse = np.sqrt(lr_mse)
lr_r2 = r2_score(y_test, lr_pred)

print("Linear Regression RMSE:", lr_rmse)
print("Linear Regression R2:", lr_r2)
Linear Regression RMSE: 0.745518188227769
Linear Regression R2: 0.5757878822842
```

Ridge Regression

```
[16]: ridge = Ridge(alpha=1.0)
ridge.fit(X_train, y_train)
ridge_pred = ridge.predict(X_test)

ridge_mse = mean_squared_error(y_test, ridge_pred)
ridge_rmse = np.sqrt(ridge_mse)
ridge_r2 = r2_score(y_test, ridge_pred)

print("Ridge RMSE:", ridge_rmse)
print("Ridge R2:", ridge_r2)
Ridge RMSE: 0.745518188227769
Ridge R2: 0.5757878822842
```

Hyperparameter Tuning using GridSearchCV

```
[17]: param_grid = {
    "max_depth": [3, 5, 7, 10],
    "min_samples_split": [2, 5, 10]
}

grid = GridSearchCV(
    DecisionTreeRegressor(random_state=42),
    param_grid,
    scoring='neg_root_mean_squared_error',
    cv=5
)

grid.fit(X_train, y_train)
```

```
[17]: = GridSearchCV
+ best_estimator_ DecisionTreeRegressor
+ DecisionTreeRegressor
```

Best Hyperparameters

```
[18]: print("Best Parameters:")
print(grid.best_params_)
Best Parameters:
{'max_depth': 10, 'min_samples_split': 10}
```

Evaluate Optimized Decision Tree

```
[19]: best_tree = grid.best_estimator_
y_pred = best_tree.predict(X_test)
mse = mean_squared_error(y_test, y_pred)
rmse = np.sqrt(mse)
r2 = r2_score(y_test, y_pred)

print("Optimized RMSE:", rmse)
print("Optimized R2:", r2)
Optimized RMSE: 0.644308628015771
Optimized R2: 0.682895259714815
```

Model Comparison Table

```
[20]: results = {
    "model": [
        "Linear Regression",
        "Ridge Regression",
        "Tuned Decision Tree"
    ],
    "rmse": [
        lr_rmse,
        ridge_rmse,
        rmse
    ],
    "r2_score": [
        lr_r2,
        ridge_r2,
        r2
    ]
}
```

Best Hyperparameter	Value
max_depth	10
min_samples_split	10

Model Comparison & Final Results

Model	RMSE	R ² Score
Linear Regression	0.745581	0.575788
Ridge Regression	0.745554	0.575819
Tuned Decision Tree	0.645430	0.682099

Conclusion

The Tuned Decision Tree Regressor achieved the best overall performance with the lowest RMSE and highest R² score. Cross-validation and hyperparameter tuning significantly improved generalization performance. The workflow followed in this project reflects industry-standard machine learning development practices.
